The geology of the area had possibly influenced the rock art found at Manyana because of existing vertical cliff resulting from the resistant semi metamorphosed sandstone. These vertical rock surfaces provided a smooth surface ideal for painting in an upright position.

The vegetation of Manyana is typically a shrub Savannah of the Eastern High-veld but show's slightly denser and taller trees then the sand - veldt at further west. The dominant species are *Peltophorum Africanum* (Weeping Wattle), *Acacia Tortillis* (Umbrella thorn) and *terminalia sericea* (silver Terminalia.

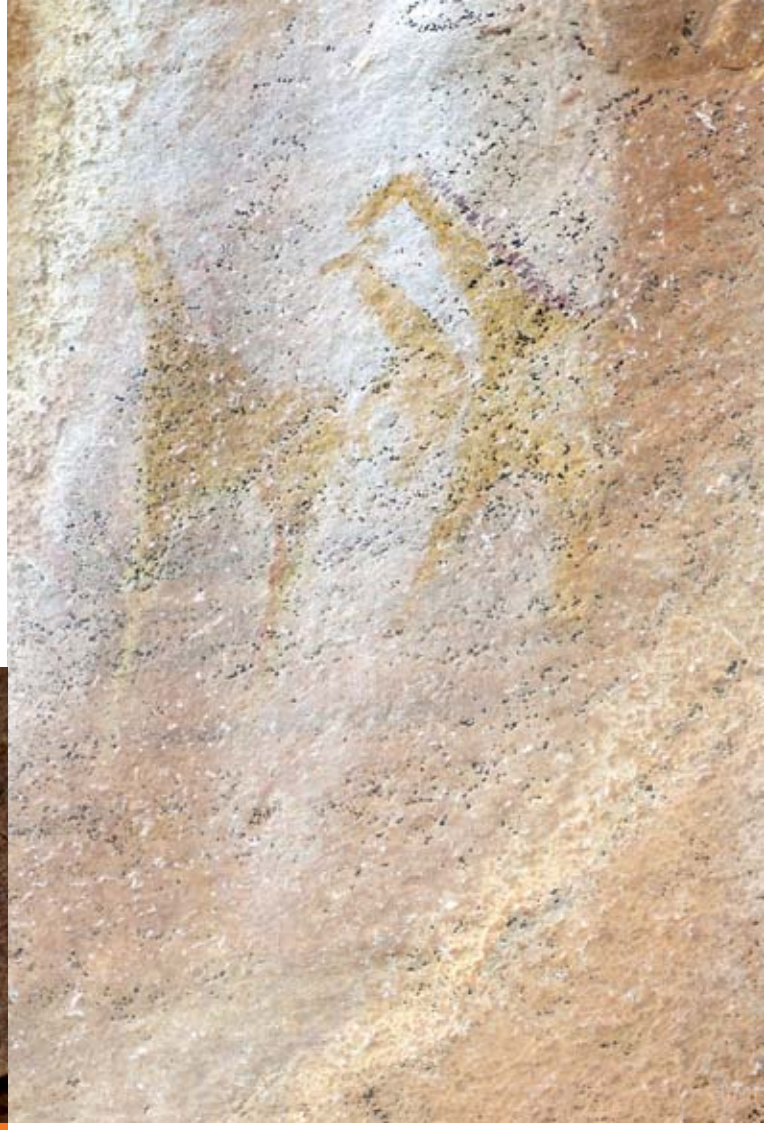

Some Rules

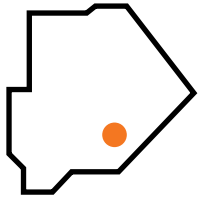

Manyana is a national Monument administered by the Botswana Museum and protected by the revised Monuments and Relics Act (2001). Adherence to some basic guidelines will make your visit worthwhile and ensure the continued protection of a part of Botswana's unique heritage:

- Use the designated parking lot
- Report to the Custodian's office and complete the visitor's book
- Do not remove any artifacts
- Cooperate with the Custodians
- Take away all your litter with you
- Please do not touch or interfere with the paintings, engravings or any other feature

PLEASE NOTE:
Researchers and commercial photographers, contact the National Museum for more information.

Designation:
Natural & Cultural
Area: approx. 3km²
Adoption priorities:
visitor interpretation centre, field assistants, signage, trails

MANYANA ROCK PAINTINGS

Manyana Rock Paintings Shelter is located in geographical position 24 45, 46 south and 25 25 01 east. It contains areas of scenic beauty at the floor of the hills and areas of historical attractions such a Livingstone (mothers) tree and rock paintings at Mma Sechele Gorge. Manyana monument occurs within the village of Manyana along the strike of a prominent hill on the south west part of the village of Manyana. The site is accessible through Gaborone - Thamaga and Gaborone - Boatle roads.

Manyana has long established itself as a historical settlement area. Whilst traditional, settlement patterns have changed significantly; Manyana retails remnants of early settlement. As such it forms an important part of the cultural heritage of Botswana. The origins of Manyana can be traced back to when the Bahurutshe Bo Manyana first settled in Dimawe from South Africa fleeing from the Boers; the sought refuge under Kgosi Sechele 1 of Bakwena. In 1852 war erupted in Dimawe between the Boers and Batswana, with the Boers demanding the return of Bahurutshe.

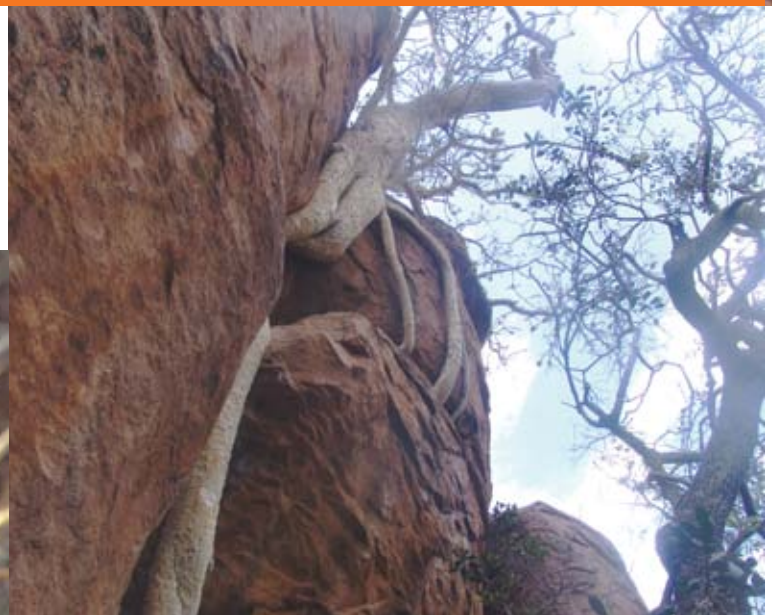

Cultural Heritage

1. Manyana rock paintings (Mmasechele Gorge) the paintings are situated at the base of the Kolobeng hills (five rock shelters or overhangs) the paintings at Manyana are of special significance because they are of the rare rock art sites in the southern eastern Botswana and the only one that has been test excavated. The paintings are found in five areas along approximately 700 meters of rock outcrops.
2. Natural: Livingstone's tree situated in the western part of the village in motlhatseng ward. A large tree known as mothers is known as shelter under which Dr David Livingstone used to preach and on which are carved the letters "D.L".

Natural Heritage

The general geology of the area around Manyana is predominately the basal Gaborone granite complex rocks and the overlaying Waterberg sediments. This area lies within the Kaapvaal carton in the southern part of Botswana and extends into South Africa. The Gaborone Granite Complex I Achaean in age, which approximately 2830 million years old. The Gaborone granite complex dominates the geology of southern Botswana and extends into South Africa covering the area around Mafikeng. This massive granite body I then overlain by correlates of the rocks of Ventersdorp (Lobatse Volcanic Group), Transvaal, and Waterberg Supergroups that range from 2700 to 1600 million years ago. The lithology of the hill in which the monument occurs is entirely sedimentary in origin. This is correlated to the Waterberg Supergroup of South Africa and is locally named Manyelanong formation. However these structures tell a story of the paelo-enviromental setting during the deposition of the rocks some 1800 to 1600 million years ago.
